EventBus

This package uses events to prompt ability activation and notify various changes in the game's condition. An event of any type can be sent to all scripts listening for an event. Be sure to put information on the details of the event, in order to validate that a certain method should be activated.

For example, if a character has a passive ability to regenerate health when dealing damage, the event invoked for dealing damage contains the information on the amount of damage dealt, the player that took the damage, and the player that dealt the damage. The passive ability's activation method will be called by any instance of player dealing damage, so before executing the logic of the method, it needs to confirm that the player who dealt the damage corresponds to the player it wants to heal.

Subscribe

Subscribes a method to the event of type T

Input: Action<T> handler

Result: method is subscribed to event of type T

Unsubscribe

Unsubscribes a method to the event of type T

Input: Action<T> handler

Result: method is unsubscribed to event of type T

Invoke

Calls all methods subscribed to the event of type T

Input: T data

Result: all subscribed methods are invoked

Clear

Erases all subscription data of type T

Input:

Result: all methods unsubscribed
