

Demo

The Demo shows a small working hero shooter like game. There are 4 characters that are composed using 2 different types of attacks, 4 different types of active abilities, and 6 different types of passive abilities. The objective is to stand in the “hotzone” in the middle for a total of 25 seconds. The game restarts afterwards.

To set the character to play, find CharAssembleInfo objects of the characters in HeroShooterMaker->Prefabs->Character, then look into team2->Player Test T2 object and set the Char Assembler’s Assemble Info variable to the character you want. The same can be done for the AI characters in the scene. The AI of the character does not automatically change from changing the character. That can be set manually as well, in the PlayerArmature, check AIProcess script and set the decision tree

BEFORE YOU RUN THE DEMO:

Make sure your project has imported TMP Essentials. TextMeshPro is used by in-game text such as damage number, ability cooldown numbers, etc.

Make sure the player input system in the client object is set to the “PlayerInputSystem” from the demo.

Make sure the character reference in the player client is set to “Player Test T2” player.
